

EASI-SLIDE™ SLIDING SHEET

Proudly made in South Africa

The EASI-SLIDE™ sheet is made from a low-friction fabric which has a certified test certificate issued by the manufacturer who is SABS approved. This low friction fabric allows the individual to slide over a surface instead of being dragged or lifted across it. This results in:

- Improved posture of the caregiver whilst they perform patient transfers and patient rolling tasks.
- **Significantly reduced forces** required for transferring patients between adjacent surfaces compared to a bed sheet or linen saver.
- **Only 1 caregiver** normally required to roll a patient or move them up/down the bed, thus **freeing up staff time** (Very large patients might still require 2 caregivers).
- Patients reporting a **greater feeling of comfort and security** before, during, and after transfers when appropriate transfer assist devices are used correctly.
- Caregivers reporting **lower perceived exertion** to shoulders, upper back, lower back, and overall body when using friction-reducing devices.

The **EASI-SLIDE™** will help reduce the amount of force required by nurses and caregivers when:

- Moving patients up/down in bed
- Moving patients from the side of the bed to the centre or vice versa
- Turning patients onto their side in bed
- Transferring patients from one surface to another - e.g. from a bed to a stretcher (when used in conjunction with other devices, such as transfer boards)
- Moving patients who have fallen into confined or awkward spaces to a place where a mechanical lift can be used
- Pivoting patients in bed and aiding exercise
- The EASI-SLIDE™ can withstand a maximum of 50 normal washes

*The EASI-SLIDE™ does not reduce the weight of a patient and should **not be used to lift, carry, or support the whole or a large part of a patient's body weight**. A safer means of moving the patient, such as a mechanical lift, may be required. Safety for both patient and caregiver must always be considered.*
